## Advisory Action

Applicant's arguments filed December 15, 2003 have been fully considered, but are not persuasive. Furthermore, Applicant's proposed amendment will not be entered because they require further search and/or consideration. Specifically, the claim would be amended to require that the joining means comprises a layer or microcavities. Such a feature was not previously required. Furthermore, the proposed amendment would introduce new claims without canceling a corresponding number of finally rejected claims. The amendment also fails to place the application in better form for appeal by materially reducing and/or simplifying the issues for appeal.

Applicant argues that Blisaro does not disclose a joining means having microcavities. However, the pending daims do not require for Bisaro to have microcavities. The claims state that the joining means is selected from the group consisting of a layer of microcavities and a bonding interface whose bonding energy is controlled to permit the absorption of said stresses.

Furthermore, the examiner maintains the position that Bisaro teaches the creation of microcavities. Specifically, Bisaro teaches the implantation of ions in order to create anchoring points that are centered at a depth Rp and having a width of 2.35XRp (col 3, lines 46+). Applicant argues that such perturbations do not read on microcavities as the term is meant in the present application. However, the term "microcavities" is never defined in the specification. Thus, the claim must be interpreted utilizing the art-accepted definition of the term.
